6 OSD Menu and User Controls

The OSD allows selection of input source and fine tuning of various functional parameters like brightness, contrast etc. These parameters can be adjusted via an external interface.

6.1 OSD Control through External Keypad

An OSD keypad can be used to control the OSD. There is a 4-Button OSD keypad available, it can be connected to CON10 of Prisma-V via cable **ZU-05-032**.

6.1.1 4-Button OSD Keypad ZU-02-398

The following tables give you an overview about the functionality.

6.1.2 OSD Control through IR Remote Control

Alternative to the external keypads, the Prisma-V can also be controlled through a remote control device. In order to communicate through IR, an IR-receiver **ZU-02-406** can be attached to connector CON25 of Prisma-V via cable **KA-30-467**. With this receiver you can control the Prisma-V using the IR Remote Control **RC-10-007** (see picture below).

6.2 Input Selection

When the OSD is closed press SW4 on your keypad (EXIT key on 4-button keypad) or button “M” on your IR remote control. This opens the dialog shown on the left where you can manually switch to a specific input port. Note that only ports which are enabled in the FW and by the MstarRover configuration software can be selected in this dialog.

If you have PiP enabled (see sec. TBD) then you can in the same way change the PiP input port: When the OSD is closed press SW2 (“-“ key) on your 4-button keypad or button “P” on your IR remote control. This opens a dialog like the one on the left.

9 Absolute Maximum Ratings

Item	Symbol	Min.	Max.	Unit	Note
Supply Voltage	V_{in}	-0.2	30	VDC	1, 2
Storage Temperature	T_{St}	-35	+85	°C	
Operating Temperature	T_{Op}	-20	+70	°C	3

Note (1) Within operating temperature range.

Note (2) Permanent damage to the device may occur if maximum values are exceeded.

Note (3) Correct operation is guaranteed from 0°C to +70°C. Specifications over the -20°C to +70°C operating temperature range are assured by design characterization and correlation with statistical process controls.

10 Electrical Specification

Remark: All values are average values of repeated measurements. Other Prisma-V types or Prisma-V / panel combinations may have different electrical characteristics. Measurements were performed at 25°C. Currents were measured at nominal supply voltage (12V and 24V, respectively).

Prisma-V covers both standard supply voltages of 12VDC and 24VDC in one assembly version.

For panels and backlight controllers requiring supply voltage of 12VDC, if the input voltage rises above 12V, the panel and backlight voltage remains at 12V for the wide input voltage range of 12.1V to 28V.

Item	Condition	MIN.	TYP.	MAX.	Unit	Note
Supply Voltage (V_{in})		10.8	12.0	28.0	VDC	1
Input Current (@12V)	Power-off		TBD		mA	
	Sleep mode		TBD	TBD	mA	
	Board only		TBD	TBD	mA	
	1280*1024		TBD		A	2
Input Current (@5V) through CON16 low-power PSU	Power-off		TBD		mA	3

- 1) Supply voltage limits are for the Prisma-V, inverter and possibly panel supply limits must be met as well, if the inverter is to be powered by the Prisma-V board or the panel SVCC setting is set to 12V.
- 2) Sample configuration: SXGA panel AUO G190EG02-V1
- 3) External power supply unit is placed in low power mode through GPIO control: +12V input voltage is switched off, only +5V is supplied through CON16 pin 1.

10.1 Maximum allowed Power Consumption for TFT Panels (V_{SVCC})

Item	Symbol	Max.	Unit	Note
3.3V, (5V), [12V] (V_{SVCC}) Panel power	I_{SVCC}	1.5, (2.6), [2.6]	A	1,2,3

10.2 Maximum allowed Power Consumption for Backlight Inverter (V_{BKL})

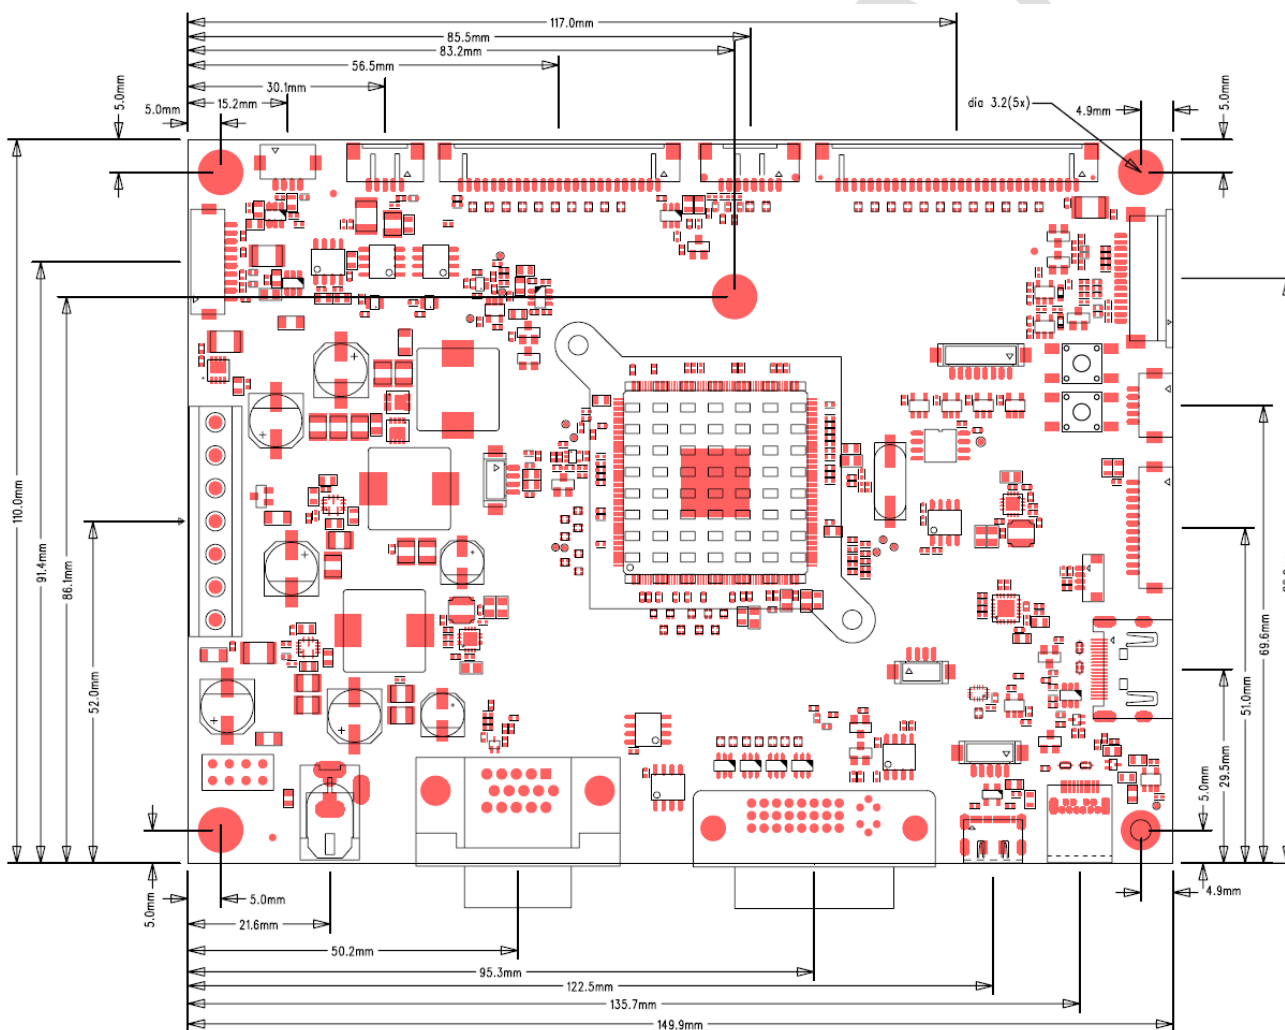

Item	Symbol	Max.	Unit	Note
+5V Backlight power on CON23	I_{BKL}	2,0	A	2, 3
+12V Backlight power on CON23	I_{BKL}	3,0	A	2, 3

- 1) Actual SVCC voltage is selected by software configuration.
- 2) Supply current limits are subject to balancing (cross load) and thermal issues. Given limits can be guaranteed for all combinations of SVCC and BKL power voltages. In case your application has higher requirements, please ask your sales contact if the desired application is possible with Prisma-V.
- 3) For the input voltage of 12V, there is a combined power limit of approximately 32 W for the group {5V Backlight, 5V SVCC, 12V SVCC} and of approx. 35 W for the group {12V Backlight, 3.3V SVCC}. For temperatures above 50°C, this is further derated. Please contact Distec sales to discuss possible solutions in case the limit might be reached.
For the input voltage of 24V, the additional cross load limitation to the above current values is that all power drawn from the board must not exceed 55W.

15 Appendix A: PSU low-power-control timings (CON16 pin 5&6)

The time between power-on/off to PSU signal state change may differ between different kits, mainly for the power-off, since the system first goes through a panel-power-down sequence which is different for every kit. Following measurements have been taken with a Samsung LTM170EU-L21 panel with C&C GH053A inverter and are average values. Given values are for the power-on/off button. IR works ~40ms faster for the first step in each case.
